Scenario-Based Decision Activity

Scenario:
Your team is developing a simple student information system. The project has defined milestones, such as completing the enrollment module, grading module, and reporting module. Although the system requirements may evolve based on user feedback, the development is planned to be done in time-boxed iterations, with regular reviews after each phase.

Task: Decide which Agile approach fits your project better at this stage and explain why.

Agile Approach: Scrum

Our team would choose **Scrum** because the project is developed in time-boxed iterations and has regular reviews after each phase. Scrum allows the team to divide the project into smaller tasks and work on them during each sprint. Scrum is also suitable because the system requirements may change based on user feedback. After each sprint, the team can review the results, receive feedback, and adjust the product backlog for the next sprint. This makes the development process more organized and flexible.

Reflection Question: How did working in a team and using Scrum or Kanban tools change your understanding of project management?

Working in a team and using Scrum or Kanban tools helped us understand that project management requires good planning, task prioritization, communication, and teamwork. Using a backlog and Kanban board also made it easier to see which tasks need to be completed, which tasks are in progress, and which tasks have been completed.

Which activity helped you learn most today (Scrum roles, backlog writing, Kanban board, scenario decision), and what will you do differently next time?

The activity that helped us learn the most was **creating the Kanban board**, because we could clearly see the progress and priority of each task. Next time, we will improve our task prioritization and communicate more frequently with team members to make sure the project progresses efficiently.
